

## PhET Tips for Teachers

### Tips for controls:

- Try all the different tabs at the top of the simulation. The tabs are designed to help teachers scaffold lessons or make lessons age appropriate by using only some tabs.
- There is an option to allow the entire tab to be reset. This may be useful if you want the class to start with the same kit for a discussion, but note that the students' collections are cleared.
- The challenge on each tab is to fill **Collections**. There are 3 ways to get the buckets to refill. To start over on a collection, use **Reset Collection**. To just refill the buckets, use **Reset Kit**. To get different buckets, use the yellow arrow on the left or right of the Kit #.

Reset Collection

Reset Kit

◀ Kit #2 ▶

- The  tool opens a Jmol window. The molecules are grabbable, so the students can rotate them to help get a good feel for the shape. You may find information about Jmol in many places, this is a good start: <http://en.wikipedia.org/wiki/Jmol>
- The collection on each of the first tabs will always be the same from the start of the sim or after **Reset Current Tab** (from the **Options** menu). There is no limit to the number of collections and the collections are randomly generated from a set of molecules, so molecules will show up in more than one collection.
- The last tab, **Larger Molecules**, has no collection windows. This tab could be used for inventive exploration.

### Important modeling notes / simplifications:

- If 2 atoms are bonded, like H<sub>2</sub>, and you want to add oxygen to make water, the oxygen cannot

be added because the H's are not located as they would be on the water. Use the  tool to separate the hydrogen or you can mouse between to atoms, the mouse will look like a pair of scissors

and you can cut just one bond.. Then position the H's like you would in Lewis structures, for

example

or

- The first tab has molecules with three or less atoms.
- The Kits that are provided can sometimes make more than one molecule. The kits are designed to provide constructive scaffold, but to allow exploration.
- The number, names, and types of molecules have been selected to optimize basic learning for students. For example, cyclic molecules or molecules with more than 4 atoms on any one atom are not included. Also, we chose a single name for structures that could have more than one name since as the molecule is being built, the bonding is not displayed.
- IUPAC naming is used <http://pubchem.ncbi.nlm.nih.gov/search/search.cgi> including using common organic molecule names like water.

### Insights into student use / thinking:

- Students figure out that where the atoms attach matters. For example: the hydrogen in water are attached to the oxygen not each other. The first tab has small molecules to help students learn how to use the separate and cut tools easily.

### Suggestions for sim use:

- For tips on using PhET sims with your students see: [Guidelines for Inquiry Contributions](#) and [Using PhET Sims](#)
- The simulations have been used successfully with homework, lectures, in-class activities, or lab activities. Use them for introduction to concepts, learning new concepts, reinforcement of concepts, as visual aids for interactive demonstrations, or with in-class clicker questions. To read more, see [Teaching Physics using PhET Simulations](#)
- For activities and lesson plans written by the PhET team and other teachers, see: [Teacher Ideas & Activities](#)
